

Same fuel in – more power out!

Againty's ORC systems convert waste heat from gas turbines to electric power.

From waste heat to electricity

When producing electricity from gas turbines, 65-75% of the fuel energy is often wasted as excess heat by the exhaust gas. The temperature of the exhaust gas is normally 350-550°C, which makes

it an excellent source of energy for Againty's ORC¹ system and facilitates a highly efficient and cost-effective conversion to electric power.

The Againty ORC System is based on the technology of the Organic Rankine Cycle (ORC). The core of the technology is a steam turbine set in motion by the pressure of hot steam. The rotating turbine then runs a generator that produces electricity.

The Againty ORC System uses thermal oil between the exhaust and the ORC unit, which prevents exposure of the working medium to the hot gases. The installation is simple and compact - no need of bypass of exhaust gases.

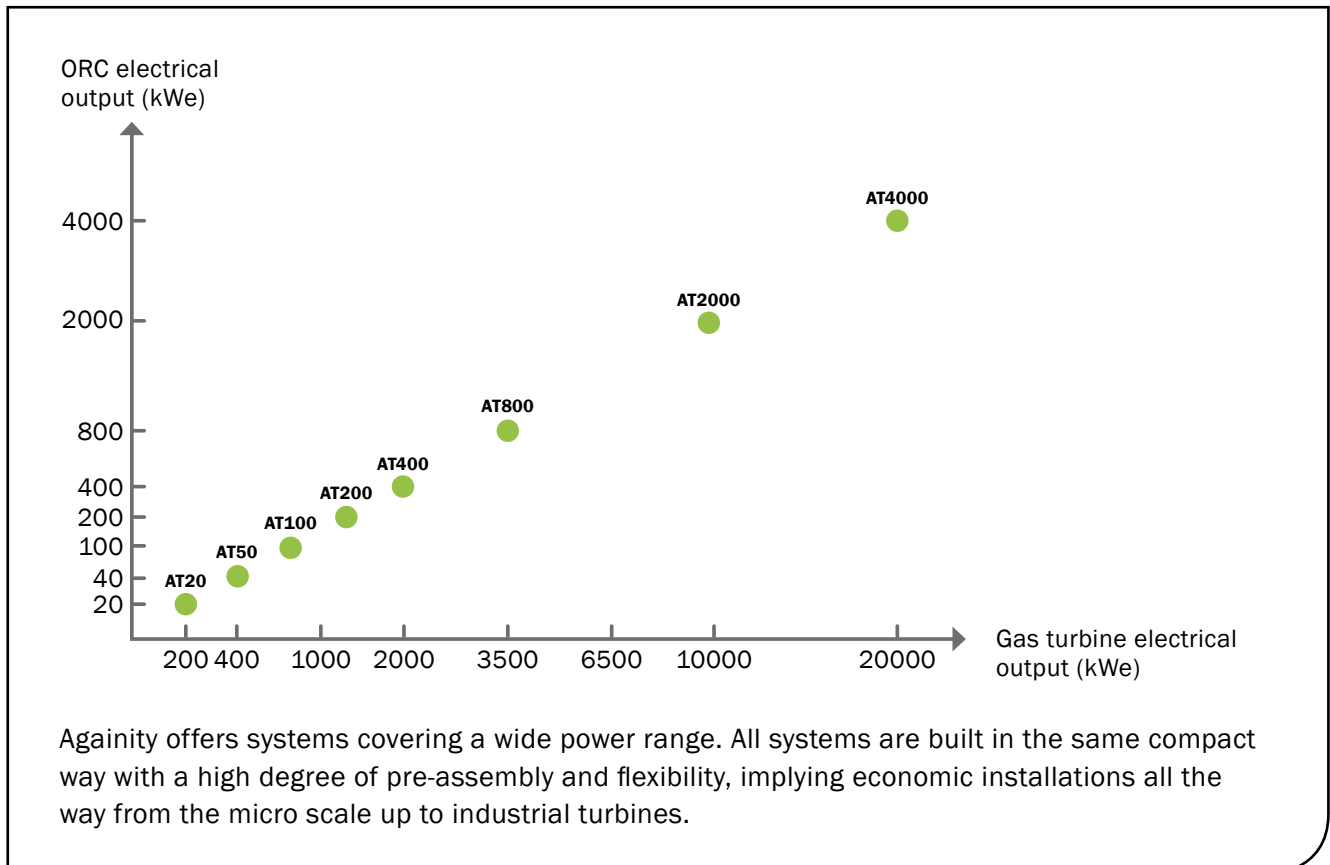

Againty's ORC turbine is a very compact unit with few moving parts. This gives a reliable turbine with a long life.

The Againty ORC System is always built with a recuperator that offers high performance yet a compact and economic installation.

The most economical way to cool the system is by using water from a nearby river or sea. When not available, air coolers are used.

**From waste heat to electricity
with Againity's ORC systems**

Againity is all about turning waste heat into something useful – electric power! It's about getting more power out of your existing system. This gives you a more energy efficient production, more performance and less cost – while saving the environment.
